About this Owner's Manual

Laurel Mountain Whirlpools has gained popularity by the variety of bathtubs available and the extensive list of options for each type of tub. This manual covers the installation, operation, and maintenance needs for the Trade Series of Laurel Mountain whirlpools, air baths, combo baths, and soaker tubs. If you have any questions or need additional information on your Laurel Mountain Whirlpools bath, you can contact our customer service department Mon-Fri at 1-800-930-0050 between 6:00 am and 6:00 pm EST.

INSTALLATION WARNING

***Your Laurel Mountain Whirlpools bathtub has been water tested prior to shipment. However, due to transportation and potential on-the-job conditions, you should NOT install this tub until making a final water test.**

***Building material & wiring should be routed away from the pump or other heat producing parts of this tub.**

Please follow these instructions to insure an easy and safe installation process. Any deviations, additions, or deletions to your Laurel Mountain Whirlpools tub or it's hardware will void the warranty of this product if written approval is not obtained from the manufacturer.

Specifications

Your Laurel Mountain Whirlpools tub was created to your order specifications. The tub was constructed from an acrylic shell cast. It was then reinforced with a mixture of chopped fiberglass in a polyester resin applied to the backside of the shell. The base of your unit was designed to give uniform support to the tub floor and has been pre-leveled. It meets or exceeds load-bearing and impact resistance requirements of the listed standard without evidence of crazing or cracking and with minimal deflection when installed in accordance to Laurel Mountain Whirlpools printed instructions.

PRIOR TO INSTALLATION

Immediately inspect your unit upon arrival. If any damage has occurred, make a notation on the freight carrier's proof of delivery. DO NOT remove the bath from its shipping container until you are ready to water-test and install. When you are prepared to remove the tub from its carton **DO NOT LIFT** the tub out by its plumbing. We also recommend cutting cardboard from the shipping container to place inside the tub to protect its floor. Even though your tub has been inspected and water tested prior to shipment, it is very important that you perform a water test of your own to ensure all of the fittings and connections were not damaged during transit. Take your tub to an area where you can fill it up, run electrical components, & drain

it. Fill your tub to the overflow and if you have a pump and/or blower, operate it for 15 minutes. Inspect the entire unit during and after for leaks. Any defects that are discovered **MUST** be reported at this time to qualify for warranty coverage. Qualified plumbers and electricians **MUST** be used for all tub connections to assure you follow local codes and acquire any permits required for the install. NEVER LIFT the unit by any portion of the plumbing or stand in the unit during installation as this may cause serious damage to the unit.

Framing-In Your Bath

*It is **VERY** important that your tub is supported by its base and not the rim.

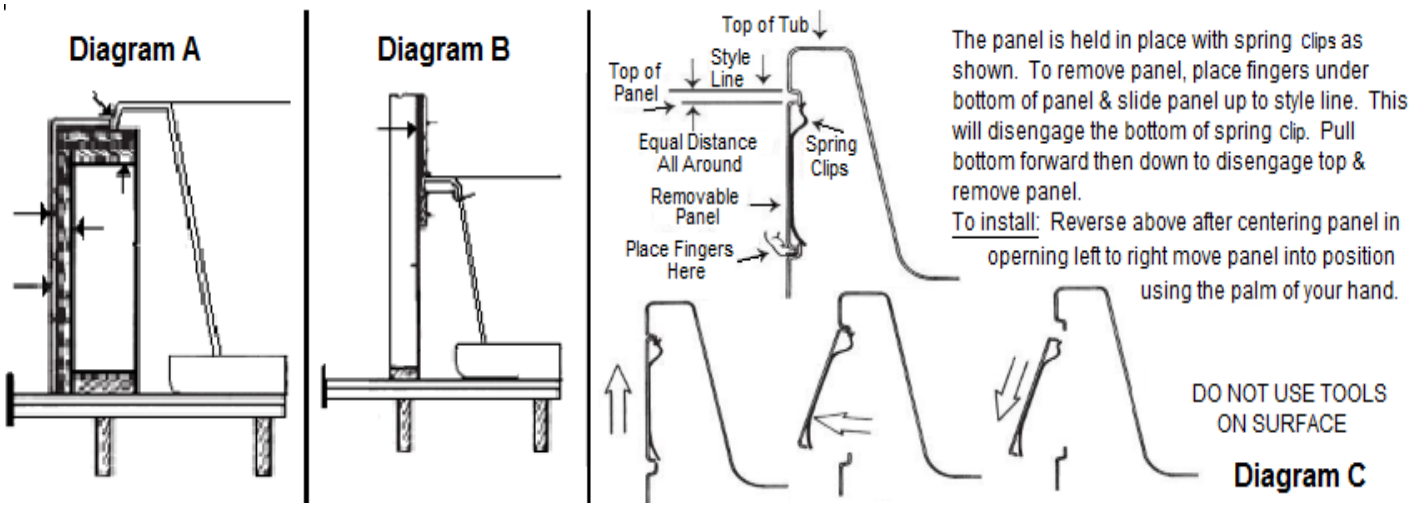
*Take your installation measurements directly from your tub, as they may vary slightly from our literature.

When installing the drain fitting, you will notice it protrudes below the bottom of the tub. You will need to allow clearance in the sub-floor for this dimension. Now you are ready to place your tub in its desired location. Check the unit and sub-floor to ensure it is level. If it is not, insert wood shims between the sub-floor and support base. Mark stud wall underneath the tub's return lip. Remove the unit from position and install a 1x stop to stud wall for lip to rest on to prevent deflection. At this time, check to see if any wiring needs to be completed (see wiring instructions).

Since a great variety of installations are possible with this bath, special framing procedures may be needed. A ledge under the rim, or an apron without a ledge, may be constructed as required. Where installation is planned against a wall, install the tub against the studs as indicated, adding blocking below the rim to prevent deflection or movement of the tub, but ensuring that the weight of the tub is not supported in any way by the blocking (Diagram A). When placing the unit in a platform floor or cut out installation, the opening should be 1" smaller than the specified rim dimensions.

A 1" integral up-flange is available on many rectangular and corner models. These units should be placed in a pre-measured studded pocket. Pre-drill holes through the flange to align with studs. Use screws to secure studs (Diagram B). **DO NOT** attempt to nail directly through the flange. **Always pre-drill the holes**.

In every "system" installation, an access panel must be placed near the pump/blower for servicing. This access may be through the wall or platform apron. In the case of a sunken installation, access may be through the ceiling below the bathtub. See **Diagram C** for instructions for the access panel provided on the skirted tub.



Electrical & Wiring Instructions

Rough in the wiring on a single 120VAC, 20 amp, GFCI protected dedicated circuit for each accessory installed on the tub.

WARNINGS:

1) All electrical connections must be made by a licensed certified electrician in accordance with the requirements of the National Electrical Code and applicable state and local codes and procedures.

2) All circuits connected to this unit must be equipped with Ground Fault Circuit Interrupter (GFCI) protection. It is the tub installer's responsibility to wire the circuit with GFCI.

3) All bathtubs equipped with a heater require two dedicated circuits. One for the whirlpool system and one for optional heater.

4) DO NOT splice a longer cord to the power supply cord and DO NOT connect to an extension cord.

All whirlpool, air systems, and heaters are equipped with a molded plug on the end of a power supply core. Install a separate, dedicated 120VAC, 20 Amp GFCI protected electrical wall plug outlet inside the access panel for each accessory equipped on the tub. For example, if the tub is equipped with a whirlpool system only, then one GFCI wall plug outlet is necessary. If the tub is equipped with both whirlpool system and a heater then two separate circuits with GFCI wall plug outlets are required. Be sure to count the number of accessories before installing the GFCI wall outlets. Also, the power supply cords equipped with each accessory are only 2.5' long so locate the GFCI wall outlet within 1.5' of the intended accessory.

Electrical Requirements

1.5 hp Pump – 120V, 7.5 Amps	Whirlpool heater – 120V, 12.0 Amps
2.5 hp Pump – 120V, 13.5 Amps	Air / Soaker heater – 120V, 12.5 Amps
1 hp Blower/Heater – 120V, 12.0 Amps	Air / Soaker heater – 240V, 16.0 Amps
Ozonator – 120V, 1.0 Amps	

Please note, that when sizing the electrical circuits to power the unit, you should always check the rating labels on equipment because there could be changes.

Plumbing Installation

Install fill valves and spout in the desired locations. Note, due to various possible fill valve and spout locations, the holes are not drilled at the factory. Make certain that the spout is long enough to clear the interior rim of the tub. If installing fill valves on the deck of the tub, be sure that you have enough clearance for connections of valve to tub and water connections before drilling/cutting into tub. Seal the joints under the tub rim and against the wall with a water resistant seal. Then install a standard 1.5" trap to the drain and overflow. Before proceeding, make a final operational check by filling the tub with water to the overflow and operate for at least 5 minutes. Leave the water in the bath for 30 minutes, check the connections for leaks during and after operation. Complete the installation with desired trim material on the back wall, side walls, and down exposed interior walls.

Operation Instructions <save these important safety instructions>

Laurel Mountain Whirlpools will not be held responsible for water damage of any kind in connection with the installation and/or operation of one of our bath tubs. All whirlpool jets must be completely submerged below water before starting the pump. **Do not operate the pump without water as damage may occur**. Do not block the overflow drain and allow water to reach the controls as they are not waterproof and leaks to the floor may occur.

Important Safety Instructions

Do

Ensure your qualified electrician supplies a Ground Fault Circuit Interrupter (GFCI) during installation. This offers necessary protection to your unit and should be tested periodically. To test, simply push the <TEST BUTTON> and power should be interrupted. Then push the <RESET BUTTON> and power should be restored. If not, DO NOT use the unit as this indicated there is a ground current flowing and that a possibility of **ELECTRIC SHOCK** exists. Disconnect the unit at once and call a qualified electrician before further operation.

Use this tub for its intended purposes described in this manual. The manufacturer does not recommend using any attachements not specifically approved in this manual.

DO NOT

Allow any electrical appliances near the bathtub.

Use alcohol, drugs or medication. This will greatly increase your risk of hypothermia or drowning.

Use this tub if you think or know you are pregnant. Consult your physician first.

Allow children to use the bathtub without adult supervision.

Operate the whirlpool without the suction cover.

Insert any objects into any of the openings.

Use options NOT installed by the manufacturer.

Care & Cleaning Instructions

WHIRLPOOL

Prior to using the whirlpool, the tub and its system(s) should be thoroughly cleaned and disinfected. **DO NOT** use abrasive cleaners on the high-gloss acrylic finish. Use a non-abrasive cleaner and rinse thoroughly after cleaning. To remove the labels on the tub, we recommend using fingernail polish remover if they do not come off easily. Fill the tub up with water at least 2" above the highest jet, then add 2 tsp. of low sudsing automatic dishwashing detergent and no more than 8 oz. of household bleach. Operate your whirlpool for 5-10 minutes and then drain the tub. Refill the tub with water and run the system for another 5 minutes, then drain. Repeat every 30 days unless an ozonator was purchased.

ALL TUBS

Your bath has an acrylic finish and will retain its high luster for years with proper care. Never use an abrasive cleaner or pad to clean your bath tub. Always use a soft cloth or sponge along with a spray liquid non-abrasive bath cleaner/disinfectant. On the metallic finish, use only a soft cloth and warm soapy water.

Whirlpool Operation

If your bath has a whirlpool system, simply pushing the push-button located on the tub will turn the tub on or off. Individual jets may be adjusted by turning the jet ring/trim clockwise and the water flow will increase, while turning the jet trim counterclockwise will decrease the water flow. The jets can be closed if turned far enough counterclockwise. The 6 jet system has a 1 ½ hp pump and requires a 20 amp dedicated circuit, 120V.

Air Bath Operation

Operation- Push the button located on the tub to turn the tub on or off. The tub operates at one speed.

Manual Purge Cycle – Once the tub is drained, wait 20 then press the ON button. Let the system run for 30 seconds to dry any remaining water in the air nozzles. The purge cycle is optional.

Functioning

1) 14 lateral turbo air injectors spaced around the lower side walls of the tub.

2) The system functions with a 1 hp blower / 300W ceramic heater that is separate from any other systems.

3) This system requires a 20 Amp dedicated circuit, 120V.

4) The ceramic air heater is designed to provide a warm air massage. It is not designed to heat the bath water.

Options & Features

Whirlpool Inline Heater - The inline heater is designed to MAINTAIN the temperature of the tub between 101-104 degrees Fahrenheit. These limits cannot be increased or decreased. The Heater is operated by a pressure switch which is programmed into the heater. This switch allows the heater to operate only when there is sufficient water flowing through the system. **DO NOT BYPASS THE SWITCH**. This option is equipped with a molded plug on the end of a supply cord. Check your local codes and install a 120VAC 20amp GFCI protected dedicated circuit wall outlet within 1.5' from the heater unit. Plug the cord into the outlet. Every time the whirlpool unit is activated, the heater will activate as well, and will MAINTAIN the water's temperature between 101-104 F.

Water Heater for Air Bath and Soaker Tubs - The on/off button on the bath tub activates/deactivates the heater. The heater has a built-in 20 minute timer and is a low flow/high efficiency pump, providing silent operation. The option is equipped with a molded plug on the end of a power supply cord. Check your local codes. For the LM305 install a 120 VAC 15amp GFCI, and for the LM306, install a 250 VAC 25amp GFCI. Both water heaters should have a GFCI protected dedicated circuit wall outlet located within 1.5' from the heater unit. Plug the cord into the outlet. This heater is designed to MAINTAIN the temperature in your tub between 101-104 deg Fahrenheit. These temperatures are preset and cannot be adjusted.

Ozonator - This factory installed option sanitizes your whirlpool. When your whirlpool system is operating your ozonator is generating ozone which is mixed with the re-circulating bath water. The ozone helps neutralize soaps, body oils and other organic and inorganic materials. This unit eliminates the need to run a sanitation solution through the tub's circulating system.

Chromotherapy Mood Light - The ColorGlo LED Multi-Color bath light comes pre-programmed with 10 light modes. To change modes, switch the unit off and then back on within 5 seconds. To resume a lighting mode, leave the unit switched off to save the last lighting mode displayed in memory. That same lighting mode will display the next time the unit is switched on.

Laurel Mountain Whirlpools Warranty

This Laurel Mountain Whirlpools bath is warranted to the original purchaser to be free from defects in material and workmanship for the following periods. The bathtub shell, pump, heater, and blower carry a 5 year warranty. Other working parts are warranted for 3 years. Proof of purchase is required.

This warranty is issued to the original purchaser and shall be effective from the date of purchase as shown on purchaser's receipt. Laurel Mountain Whirlpools will repair or replace (at their choice) any unit which proves to be defective in material or workmanship under normal use and service, having been properly installed. This warranty is the only express warranty made by Laurel Mountain Whirlpools and is limited to the duration of this warranty. Any labor charges and/or damage incurred in installation, repair or replacement as well as incidental and consequential damages connected therewith are excluded and will not be paid by Laurel Mountain Whirlpools. Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you. This warranty is void for any damage to the bath due to abuse, misuse, neglect, accident, improper installation, any use violating instructions furnished by us, or repair not authorized in writing by Laurel Mountain.

WHIRLPOOL

PROBLEM	SOLUTION
ON/OFF BUTTON Won't depress	Remove trim ring and plunger. Clean interior, lubricate with small amount of vasoline.
PUMP -Won't Start	-Check to see if on/off switch or pneumatic switch is ON. -Check electric power supply. Reset the circuit breaker or replace fuse if necessary. -Check ground fault circuit interrupter. Reset if tripped. -Check to see if both ends of plastic air switch tubes are connected.
-Motor hums	Check for binding of motor shaft or obstruction in pump. Manually rotate motor shaft to see that shaft turns freely.
	-Check to see if highest jet is clogged. Check to see that water is at a high enough level for pump to prime. -Check for air leak in suction line. Slightly loosen pump union & then retighten by hand. -Check for obstruction in piping system.
LEAKS -Pump Unions -Pump o-ring or seal -Pipe to Jet	Loosen pump unions and inspect o-ring for proper sealing. Retighten. Call Laurel Mountain Whirlpools customer service at 1-800-930-0050
JET Low/no water pressure	Turn the trim ring around the jet. This will open/close the jet.

AIR BATH

PROBLEM	SOLUTION
BLOWER -Fails to operate	-Check electric power supply. Reset the circuit breaker or replace fuse if necessary. -Check ground fault circuit interrupter. Reset if tripped. -If the system has been functioning for an extended period of time, it is possible that the thermic protection has shut off the motor. Allow to cool off for at least 30 minutes before further use.
MOTOR -Runs but no air blown through jets	Verify that the main air hose from the manifold to the blower is properly connected. If necessary, reconnect and tighten clamps.
JET HEAD AIR OUTLETS -Are obstructed	If the air outlets of a jet head are obstructed by soap or other residues, fill the tub with warm water, then switch the system on and off several times. The air outlets should be cleared, if this is not sufficient, carefully tap on the jet heads with the handle of a screw driver or similar tool while the blower runs.
AIR HEATER -Does not appear to be working	-Fill the tub to working level & operate blower on high for 5 minutes. Carefully feel the flexible connection hose where it connects to blower. The hose and its immediate area should feel warm to the touch, if not,call Laurel Mountain Whirlpools -If your tub is installed against 2 outside walls, adequate insulation is recommended to minimize heat loss.
