1. Add water (approximately 1-2 Tbsp.) into inlet to wet the impeller of the pump.

2. Attach clear suction hose (included) to suction strainer (included) by pushing the male threaded end into the rubber coupler on the suction strainer. Then place the strainer in at least 1/2 in. of water at the lowest point to be pumped.

3. Thread the other end of the clear suction hose onto the suction inlet of the pump.

4. Thread a 5/8 in. or larger garden hose (sold separately, max 50 ft. length) to the discharge outlet on the pump.

5. Attach the pump to a sturdy base (table, board, etc.) to prevent it from tipping over. Make sure the hoses are as straight as possible.

6. To operate, plug the pump into a GFCI outlet.

Please see the instruction manual for further detailed information. This guide neither supplements nor replaces the instruction manual.
