

## PROJECT PLANNER

Follow the steps below to calculate out the total number of cartons of STAINMASTER<sup>®</sup> you will need for your project.

### STEP 1

First, measure the length and width of your space [A,B].

length [A]	width [B]
Project 1	
Project 2	
Project 3	
Project 4	

### STEP 2

Next, multiply the length [A] by the width [B] of your space to determine the estimated square footage [C].

$$\frac{A}{\text{length (ft)}} \times \frac{B}{\text{width (ft)}} = \frac{C}{\text{estimated square footage}}$$

estimated square footage [C]
Project 1
Project 2
Project 3
Project 4

### STEP 3

Next, multiply your estimated square footage [C] by 1.10 to account for the 10% waste factor (for cutting and installation errors), this will give you the total square feet required [D] to complete your project. *Make sure you round up.*

$$\frac{C}{\text{estimated square footage}} \times \frac{1.10}{\text{waste factor}} = \frac{D}{\text{total required square feet}}$$

total required square feet [D]
Project 1
Project 2
Project 3
Project 4

### STEP 4

Finally, in order to find the total number of cartons you need [E], divide the total required square feet [D] by the carton square footage of the floor you are installing. *Make sure you round up.*

$$\frac{D}{\text{total required square feet}} \div \frac{19.22}{\text{plank carton sq ft}} = \frac{E}{\text{total number of cartons}}$$
