

SnapFence® Q.U.I.C.K.™ In-Ground Fence Frame Installation Instructions

PARTS LIST:

STEP 1 Install Ground Anchors (Drill Required)

Using a drill with an auger bit, install the ground anchors at the fence locations.

Anchors must be straight, level, and set to proper depth.

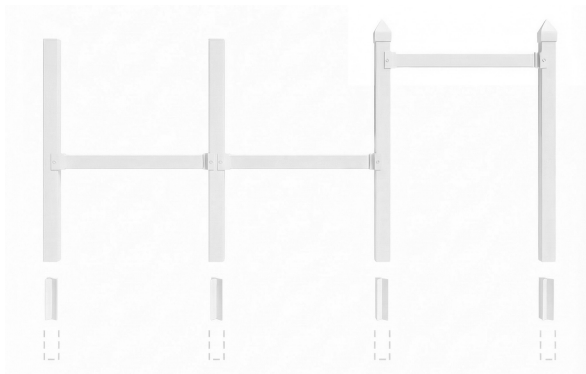

All fence alignment begins with correctly installed ground anchors.

STEP 2 Install Vertical Posts

Place the vertical posts onto the ground anchors. Do not secure with screws at this stage. Confirm posts are plumb and properly aligned.

STEP 3 Install Horizontal Rails (Starting Position)

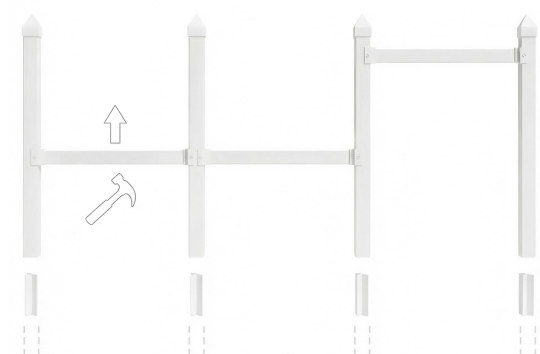

During assembly, place the horizontal rails at a **lower starting position** on the vertical posts (approximately mid-height).

This temporary position allows easier alignment while assembling the full fence section.

STEP 4 Install Post Caps

Once all posts and rails are installed and aligned, install the post caps on all vertical posts.

STEP 5 Tap Rails Up Into Final Position

After the entire fence section is assembled and aligned, **tap the horizontal rails upward** into their final position to achieve proper spacing.

STEP 6 Secure the Fence

When the fence is positioned exactly as desired, **secure all components with screws**.

Important Installation Notes

- Assemble the entire fence section before final fastening
- Screws are installed only after final alignment
- Final adjustments are easiest before components are secured
