

pothos

LIGHT

Bright, indirect light is best.

Tolerates low light, but variegated types may lose color. Avoid direct sunlight, which can scorch the leaves.

WATER

Water when the top 1–2 inches of soil are dry. Water thoroughly; let soil dry out between waterings. Reduce in winter.

FERTILIZE

Feed every 4–6 weeks in spring and summer with a diluted balanced fertilizer. Little feeding needed in fall and winter.

PROPAGATE: Simply cut a long vine off of the plant and place the fresh cutting in a cup with a little water.
