

Floralife® Hydrate Hydrangea is specifically formulated to hydrate and condition hydrangeas after harvest and after a period of dry storage. This product increases flower quality throughout the supply chain and consistently result in better vase life performance. Floralife® Hydrate Hydrangea relies on new technology specifically formulated for hydrangeas to enhance the flow of liquid through the flower stems to provide long lasting hydration and prevent premature and unpredictable wilting.

Directions for use

1. Prepare the solution using a dosing unit that is properly calibrated or hand mixed according to the label instructions. If hand mixing, dispense 5 ml of Hydrate Hydrangea per one quart (1 liter) of water (0.5% solution).
2. Make sure the flower container is clean and sanitized prior to use.
3. Recut hydrangea stems with a clean, sharp cutting tool, removing at least 1 inch. Remove foliage from the hydrangea stem that will be located below the solution level in the bucket.
4. Good temperature management is critical throughout the distribution chain to the quality, freshness and optimal vase life of the hydrangeas. Place hydrangeas in a bucket solution of Hydrate Hydrangea for a minimum of 4 hours at room temperature or in a cooler for longer storage (approx. 2 - 4° C).
5. If Hydrangeas are going to ship dry, allow flower stems to completely dry before putting them in a shipping box.
