

Say goodbye to constantly opening cans of finish for your projects. While cans are great for transporting finishes, they're not designed for pouring and storing. Resealing them after use introduces oxygen, which starts the polymerization/curing process.

StopLossBags® preserves the fresh-off-the-shelf quality of your fine finishes by minimizing evaporation and oxidation. They offer easy dispensing with a simple twist of the cap. Squeezing out any air after filling or dispensing significantly prolongs the life of the finish. Tests consistently show over 99% preservation even after two years of storage. And when you're done with the finish, clean out the StopLossBags® and use it again!

StopLossBags® Collapsible Funnel (If included): This specially formulated funnel allows for easy one-step transfer from a quart or liter can to a StopLossBags® bag. It stretches over the can's top, while the small end fits the bag's spout. **Important:** Before attaching the bag to the funnel, blow air into the bag to facilitate complete transfer of the finish. The funnel is easy to clean. Simply place it upside down on a folded paper towel overnight. Dried varnish peels easily from the inside.

StopLossBags® Filler & Adapter Tube Set and Filler Clip (If included) provide a versatile solution for transferring finish from cans to your bag. The dark grey filler tube fits snugly over the spout of the bag, designed for use with smaller funnels. For those who prefer using larger funnels, the included flexible red adapter tube connects securely to the grey filler tube, allowing for a wider range of funnel sizes. The Filler Clip acts like a third hand, just clamp it to a tabletop and slide the base of the nozzle into it.

Alert: We have received reports of blisters forming on the outside of our bags when used to store certain finish solvents such as isobutanol, MEK and MIK. We recommend against storing these solvents in StopLossBags®.

We wish you success with your projects! We hope StopLossBags® becomes a valuable addition by reducing waste, saving you money, and achieving better results. Please remember to clean and reuse them!

Strategies for Getting the Best Results with your StopLossBags®

Before filling the bag write the type of finish and the date with a felt-tip pen on the front of the bag. If you want to change your notation, it wipes away immediately by rubbing it with isopropyl alcohol.

Dispense what you need from the bag into a wide container. We have found the 24 oz plastic storage container (available from the supermarket) to be a good choice. They are made of polypropylene that many finishes will not stick to. After several uses the accumulated finish can be peeled off the inside surface. Like our Collapsible Funnel, they may offer cleaning without solvents.

To extend the life of your filler & adapter tubes remove them from the funnel after use so the flexible plastic can "relax" during storage. Some users report good results by keeping brush cleaner or solvent in a small jar to dip them in, then standing them upright on a paper towel to wick away liquid as they dry.

Hint: a light coating of wax on the threads of the cap makes it easier to remove. Grooved ridges at the base of the spout help collect drips. Finish is most easily removed from the ridges after the finish hardens, wiping with alcohol helps clean the Bag as well.

StopLossBags® are reusable! And can also be used for cleaning liquids such as isopropyl alcohol, paint thinner, and water.

Easily remix / stir finishes by rotating and massaging the StopLossBags®, the clear bag lets you see when you're finished.

Patented Design and in use for well over a decade

Happy Finishing with StopLossBags®! Don't forget to reuse the bag and share the savings with a friend.
