

General Use & Care Manual: Propane Gas Fire Pit

NOTE: This is a general guide for use & care of a propane gas fire pit and is not intended to replace the information provided within the original owner's manual. Refer to the original owner's manual for complete, detailed information for using and operating your gas fire pit.

Gas fire pits need to be operated with caution.

Operate your gas fire pit safely by following a few simple precautions.

Installation and Operation

Read the owner's manual thoroughly before using the gas fire pit. The original owner's manual will provide all information for safe operation of your gas fire pit.

Select a Secure Location

Gas fire pits must be located at a safe distance from buildings and combustible materials. Never install a gas fire pit close to a power source, or overhanging power cables. Generally, a distance of at least 3 meters from nearby structures is recommended. Never use portable gas fire pits inside your home. Fire pits are only meant for outdoor use.

Propane Only

Our portable propane fire pits are designed for use with a propane cylinder only; the propane cylinder is not included. Do not attempt to connect to a remote gas supply. Always ensure the propane tank (not included) is secured in the propane stand. Inspect the tank and valves prior to every use. Always turn the cylinder valve off when the fire pit is not in use.

Check for Gas Leaks

Always rule out the possibility of a gas leak before you light the fire pit. Inspect the fire pit and the tank before each use. If you smell gas, do not light the fire pit.

Consider the Wind Factor

Consider the strength and direction of the wind before you light the fire. A strong wind can quickly lead to huge flames that may be difficult to control. It is best to wait until the winds have subsided before igniting a fire.

Clean Regularly

Regularly clean the area surrounding the gas fire pit; clear any twigs, leaves, and paper. Never leave combustible materials near a gas fire pit. You must also clean the fire pit and the burners regularly to prevent any blockage of the pilot housing and burner ports.

Safety First

Always keep a fire extinguisher or water hose nearby in case a fire gets out of control.

Be very careful when inspecting the fire pit and when lighting it.

Sit a safe distance away from the fire pit.

Children must never be left alone or unsupervised near a gas fire pit, even if it is turned off.

Even after you turn it off, the fire pit will be considerably hot for some time.

Never leave the area before the fire is completely put out.
