

## How To Measure

1. Measure the exact width of the garage door opening # 1 AND # 2 (from door jamb to door jamb, not from the weather strips). These measurements should both be the same size, but may not be. Make no allowances.
2. Measure the exact height of the garage door opening # 3 AND # 4 (from the door header (not the weather strip) to the floor). These measurements should both be the same size, but may not be. Make no allowances.
3. Give us the WIDTH (1st) x HEIGHT (2nd) for your measurement. For example, 16' (width) x 7' (height) (Make sure you do not mix these sizes up because the screen will not fit!) **NOTE:** The screen will have zippers as indicated by the [blue](#) lines.

Measure as below for garage door openings with 45° angles

1. and 2. Measure the width and height as shown on this chart.
3. Measure the exact height where the angle begins (#3 on the left and #4 on the right). These measurements should both be the same size, but may not be.
4. Measure the exact length of the angles (#5 on the left and #6 on the right). These measurements should both be the same size, but may not be.
5. Measure the exact width between the angles at the top of the header. (#7) **NOTE:** The screen will have zippers as indicated by the [blue lines](#) and will roll up in between the angles.
